

Initiating Hope & A Helping Hand with Information & Guidance.

Out of nowhere imagine yourself in the situation of arriving at an ICU to find a loved one in a coma, isolated in a glassed room with all medical staff wearing full PPE. While you're on the outside looking in.

Depending on your personality you are either analytical or emotional in that situation. Most are not ready to comprehend the verbal information which is given to them. In this situation you've probably only have the bare necessities that you carry around on a daily basis.

Current System Delivering Information Hasn't Changed Since 1997

In this scenario there isn't a concise and informative way to provide a patient or their guardian the relevant information in a way that would best suit this situation.

The solution, Bounce Back is a two part system that allows the parent, partner or guardian to access information at a pace and in a way which best suits them.

The aim of the product is to improve a patient's physical recovery and rehabilitation experience after contracting Meningococcal, Meningitis and/or Septicaemia. This requires a deep understanding of physical and mental tolls on the human body as any acquired brain injury can result in physical and mental difficulties.

The purpose of this two part system is to provide a service which acts as a way to connect and inform the carer with relevant and up to date information and a way to communicate with those in a similar situation.

The physical aspect of this system provides the carer with a way to organise the chaos this situation brings. The Bounce Back's service is utilised initially by the carer then by the patient once they can comprehend the situation, they find themselves in.

The activities contained within this system acts as a way to stimulate the brain and test areas where mental difficulties may lie.

The intent is to provide some tools to guide the healing process so coping mechanisms aren't developed.
